

# Package: tapLock (via r-universe)

October 29, 2024

**Title** Seamless Single Sign-on for 'shiny'

**Version** 0.2.0

**Description** Swift and seamless Single Sign-On (SSO) integration. Designed for effortless compatibility with popular Single Sign-On providers like Google and Microsoft, it streamlines authentication, enhancing both user experience and application security. Elevate your 'shiny' applications for a simplified, unified, and secure authentication process.

**License** MIT + file LICENSE

**URL** <https://github.com/ixpantia/tapLock>

**BugReports** <https://github.com/ixpantia/tapLock/issues>

**Imports** curl, glue, httr2, jose, lubridate, promises, purrr, stats, stringr, shiny, tower (>= 0.2.0)

**Suggests** knitr, rmarkdown, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Repository** <https://ixpantia.r-universe.dev>

**RemoteUrl** <https://github.com/ixpantia/taplock>

**RemoteRef** HEAD

**RemoteSha** 2f61b99397430b180060841f8526b4abfe9a5a45

--------------	----------

---

add_auth_layers	<i>Add authentication middle ware to a 'tower' object</i>
-----------------	-----------------------------------------------------------

---

### Description

Attaches the necessary authentication layers to a 'tower' object. This will secure any layer added after.

### Usage

```
add_auth_layers(tower, config)
```

### Arguments

tower	A 'tower' object from the package 'tower'
config	An 'openid_config' object

### Value

A modified 'tower' object with authentication layers

---

expires_at	<i>Get the expiration date and time of an access token</i>
------------	------------------------------------------------------------

---

### Description

Gets the expiration date and time of an access token

### Usage

```
expires_at(token)
```

### Arguments

token	An access_token object
-------	------------------------

**Value**

A POSIXct object containing the date and time the token expires

---

*expires\_in*                      *Get the expiration time of an access token*

---

**Description**

Gets the expiration time of an access token

**Usage**

`expires_in(token)`

**Arguments**

`token`                      An `access_token` object

**Value**

A duration object containing the time until the token expires

---

*get\_token\_field*                      *Get the issued at time of an access token*

---

**Description**

Gets the issued at time of an access token

**Usage**

`get_token_field(token, field)`

**Arguments**

`token`                      An `access_token` object  
`field`                      The field to get from the token

**Value**

A POSIXct object containing the date and time the token was issued

---

is_expired	<i>Check if an access token is expired</i>
------------	--------------------------------------------

---

**Description**

Checks if an access token is expired

**Usage**

```
is_expired(token)
```

**Arguments**

token	An access_token object
-------	------------------------

**Value**

A boolean indicating if the token is expired

---

is_valid	<i>Check if an access token is valid</i>
----------	------------------------------------------

---

**Description**

Checks if an access token is valid by checking if it is expired

**Usage**

```
is_valid(token)
```

**Arguments**

token	An access_token object
-------	------------------------

**Value**

A boolean indicating if the token is valid

---

new\_auth0\_config      *Create a new auth0\_config object*

---

**Description**

Creates a new auth0\_config object

**Usage**

```
new_auth0_config(client_id, client_secret, auth0_domain, app_url)
```

**Arguments**

client_id	The client ID for the app
client_secret	The client secret for the app
auth0_domain	The domain for the Auth0 tenant
app_url	The URL for the app

**Value**

An auth0\_config object

---

new\_entra\_id\_config      *Create a new entra\_id\_config object*

---

**Description**

Creates a new entra\_id\_config object

**Usage**

```
new_entra_id_config(tenant_id, client_id, client_secret, app_url)
```

**Arguments**

tenant_id	The tenant ID for the app
client_id	The client ID for the app
client_secret	The client secret for the app
app_url	The URL for the app

**Value**

An entra\_id\_config object

---

`new_google_config`      *Create a new google\_config object*

---

### Description

Creates a new `google_config` object

### Usage

```
new_google_config(client_id, client_secret, app_url)
```

### Arguments

<code>client_id</code>	The client ID for the app
<code>client_secret</code>	The client secret for the app
<code>app_url</code>	The URL for the app

### Value

A `google_config` object

---

`new_openid_config`      *New openid configuration*

---

### Description

Creates a new openid configuration object for the given provider. You can use this function or the individual provider functions.

### Usage

```
new_openid_config(provider, app_url, ...)
```

### Arguments

<code>provider</code>	The openid provider to use
<code>app_url</code>	The URL of the application (used to build redirect, login, and logout URLs)
<code>...</code>	Additional arguments passed to the provider's configuration. This depends on the provider. The "google" provider accepts the following arguments: <ul style="list-style-type: none"> <li>• <code>client_id</code></li> <li>• <code>client_secret</code></li> </ul> The "entra_id" provider accepts the following arguments:

- `client_id`
- `client_secret`
- `tenant_id`

The "auth0" provider accepts the following arguments:

- `client_id`
- `client_secret`
- `auth0_domain`

### **Value**

An `openid_config` object

---

`print.access_token`     *Print an access token*

---

### **Description**

Prints an access token's expiration date

### **Usage**

```
## S3 method for class 'access_token'  
print(x, ...)
```

### **Arguments**

<code>x</code>	An <code>access_token</code> object
<code>...</code>	Ignored

### **Value**

No return value, called for side effects

---

token	<i>Get the access token</i>
-------	-----------------------------

---

**Description**

Gets the access token from the session to be used for internal logic.

**Usage**

```
token(session = shiny::getDefaultReactiveDomain())
```

**Arguments**

session      A Shiny session

**Value**

An `access_token` object
